isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for sercityling. This sequence corresponds to the NSJ/NS4
                                     region of HCV subtype 3a and is taken from a clone designated

Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV.
Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ41058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 3 and type 1 sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                     HCV genome revealed the existance of three distinct groups of HCV. Manalysis of the region encompassing -255 to -62 of the 5, non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were sequences between the three groups. Two of the groups identified were appeared to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phytogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 3 and type 1 sequences.
                                                                                                                                                                                                                                                                       46

The sequences given in AAQ43106-111 show bases 4911-5277 of the NS4 region of hepatitis C virus-3 (HVV-3) samples.from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HVV genome revealed the existance of three distinct groups of HVV.

Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43088-75) showed a difference of 9-14% in the nucleocitiee squences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the N3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same region between type 3 and type 1 sequences.

C degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 3 and type 1 sequences.

C (Updated on 25-MAR-2003 to correct PN field.)

The sequence encodes a polypeptide contg. a 3023 amino acid sequence (see AAR94462) which can be easily detected by antibodies in an assay for the detection of HCV. The DNA and the protein are useful for classifying the subtype of HCV. At least a part of the protein may be used as a vaccine against HCV.
                                                                                               GluValLeuTyrGlnGlnTyrAspGluMetGluGluCysSerGlnAlaAlaProTyrIle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAQ43106-111 show bases 4911-5277 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ49058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with degree differentiation was noted in the NS-5 (see AAR37923-26) and core
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     62

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAQ43106-111 show bases 4911-5277 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existence of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GluGlnAlaGlnValIleAlaHisGlnPheLysGlyLysValLeuGlyLeuLeuGlnArg 107

  The sequences given in AAQ43106-111 show bases 4911-5277 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 included the NS3 behing phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core frigion between type 3 and type 1 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             107

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   101 ValLeuGlyLeuLeuGlnArgAlaThrGlnGlnGlnAlaValIleGluProIleValThr 120
                                                                                                                                                                                                         The present invention relates to a new DNA or RNA comprising a hepatitis C virus (HCV) sequence capable of productive replication in a host cell. The molecules of the invention comprise 5 to 3 on the positive sense strand a functional HCV 5 non-translated region comprising an extreme 5'-terminal conserved sequence, an HCV polyprotein coding region and a functional HCV 3' non-translated region comprising an extreme 3'-terminal conserved region. The DNA or RNA Hs used to detect and develop treatment for infection by hepatitis C virus. The present nucleic acid sequence encodes the hepatitis C virus (HCV) H77
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             90

Patent No. 6127116
GENERAL INFORMATION:
APPLICANT: RICE, Charles et al.
TITLE OF INVENTION: FUNCTIONAL DNA CLONE FOR HEPATITIS C
TITLE OF INVENTION: VIRUS (HCV) AND USES THEREOF
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/09/034,756
FILING DATE: 04-May-1998
CLASSIFICATION: <UNknown>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9646

Sequence 43, Application US/08483695
Patent No. 5866139
GENERAL INFORMATION:
APPLICANT: Brechot, Christian
APPLICANT: Forchon, Colette
TITLE OF INVENTION: Hepatitis C Virus Isolate, Diagnostic and Therapeutic
TITLE OF INVENTION: Applications
NUMBER OF SEQUENCES: 46
CORRESPONDENCE ADDRESS:
ADDRESSEE: Finnegan, Henderson, Farabow, Garrett &
ADDRESSEE: Pinnegan, Henderson, Farabow, Garrett &
ADDRESSEE: Dunner

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A Title: Japanese isolates of the non-A, non-B hepatitis viral genome show sequence variance in the sequence number: PS0085
A; Reference number: PS0085
A; Molecule type: genomic RNA
A; Residues: 2650-2707 (KAZ)
A; Experimental source: Japanese isolate
C; Comment: The cleavage sites of this polyprotein have not been determined.
C; Superfamily: hepatitis C virus genome polyprotein
C; Keywords: ATP; glycoprotein; hydrolase; nucleotide binding; P-loop; polyprotein; E; 2-115/Product: envelope protein M #status predicted (KEPM)
F; 101-191/Product: major envelope protein B #status predicted (NS)
F; 1006/Product: nonstructural protein NS2 #status predicted (NS2)
F; 1006/Product: nonstructural protein NS2 #status predicted (NS2)
F; 101-131/Region: nucleotide-binding motif A (P-loop)
F; 1312-1317/Region: nucleotide-binding motif B F; 1312-1312/Region: nucleotide-binding motif B F; 1312-1317/Region: nucleotide-binding motif B F; 1312-1317/Region: nucleotide-binding motif B F; 1312-1317/Region: nucleotide-binding motif B F; 1312-1312/Region: nucleotide-binding motif B F; 1312-1317/Region: nucleotide-binding motif B F; 1312-1317/Region: nucleotide-binding motif B F; 1312-1317/Region: nucleotide-binding motif B F; 1312-13127/Region: nucleotide-binding motif B F; 1312-13127/Region: nucleotide-binding motif B F; 1312-13127/Region: nucleotide-binding

-!- FUNCTION: NS5A SEBNS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
-!- FUNCTION: NS5A SEBNS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
-!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIROS REPLICATION.
-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
-!- CATALXTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kim J.L., Morgenstern K.A., Griffith J.P., Dwyer M.D., Thomson J.A., Murcko M.A., Lin C., Caron P.R.; "Hepatitis C virus NS3 RNA helicase domain with a bound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               딥

THE ENVELOPE CONSISTS OF TWO PROTEINS: AND E2. THE NUCLEOCARSID IS. OF PROPERINS: PTHE STRUCTURAL PROTEINS C, EI AND E2 ARE PRODUCED BY PROTEINT C, ROCEESING BY THE STRUCTURAL PROTEINS C, EI AND E2 ARE PRODUCED BY SIGNIFICATITY: THE NS2 PROTEINS EBLONGS TO PEPTIDASE FAMILY 139. SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Prince A.M.; "Genomic structure of the human prototype strain H of hepatitis virus: comparison with American and Japanese isolates."; Proc. Natl. Acad. Sci. U.S.A. 88:10292-10296(1991).

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROFIEIN A AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRAN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DISCUSSION OF SEQUENCE.
